Division of Neonatology, Center for Maternal, Fetal and Neonatal Medicine,
Fukuoka University Hospital, Fukuoka Japan

Department of Pediatrics, School of Medicine, Fukuoka University, Fukuoka Japan
Case 1. (Female): In this case, a female patient was admitted to the hospital with symptoms of confusion and memory loss. The patient's medical history revealed a recent episode of viral illness. On physical examination, the patient was found to have a high fever and a rash. Laboratory tests revealed a high white blood cell count and a positive result for a viral infection. The patient was treated with antiviral medication and supportive care. The patient's condition improved over the course of several days.
Case 2. (Male): A detailed examination of the brain scans of the patient revealed that the brain cells were not functioning properly. The patient was suffering from a severe condition that affected their cognitive abilities. The treatment plan was developed to address the underlying cause of the condition and improve the patient's quality of life. The patient's condition improved significantly after the treatment, and they were able to manage their symptoms effectively.
