Abstract

Oncoplastic breast surgery (OBS) has become widely known and a partial breast mastectomy has been performed with a variety of techniques. In order to achieve a better post-surgical appearance of breasts, the partial breast mastectomy for breast cancer is required to maintain symmetrization with the contralateral breast with less deformity. In this report, we performed a partial mastectomy with one of the techniques of OBS, a Rotation flap, in a case with remarkably-reduced tumor by preoperative chemotherapy and the widely-remained calcified lesions, and eventually, good cosmetic results were obtained.

Key words: Oncoplastic Breast surgery, breast conserving surgery, rotation flap wide range of calcified lesions, preoperative chemotherapy
